2.1 Introduction

2.2 Estimating the Population Mean of Potential Outcomes

2.3 Application of Convex Optimization

Assumption 2.1. *Assume that the map $f : \mathbb{R} \to \overline{\mathbb{R}}$ has the following properties.*

(i) f is strictly convex.

(ii) f is lower-semicontinuous and continuously differentiable on $\mathrm{int}(\mathrm{dom}(f))$.

(iii) The derivative of f on $\mathrm{int}(\mathrm{dom}(f))$ is a diffeomorphism.

(iv) The Legendre transformation f^* of f is finite.

(v) The function $x \mapsto xt - f(x)$ takes its supremum on $\mathrm{int}(\mathrm{dom}(f))$ for all $t \in \mathbb{R}$.

We consider the following optimization problem.

Problem 2.1.

$$\underset{w_1,\ldots,w_n \in \mathbb{R}}{\text{minimize}} \quad \sum_{i=1}^{n} T_i f(w_i)$$

subject to the constraints

$$w_i T_i \geq 0, \qquad i = 1, \ldots, n,$$

$$\sum_{i=1}^{n} w_i T_i = 1$$

$$\left| \sum_{i=1}^{n} w_i T_i B_k(X_i) - \frac{1}{n} \sum_{i=1}^{n} B_k(X_i) \right| \leq \delta_k, \qquad k = 1, \ldots, K$$

Theorem 2.1. *Under Assumption, the dual of the above Problem is the unconstrained optimization problem*

$$\underset{\lambda \in \mathbb{R}^K}{\text{minimize}} \quad \frac{1}{n} \sum_{i=1}^{n} nT_i f^*(\langle B(X_i), \lambda \rangle) - \langle B(X_i), \lambda \rangle + \langle \delta, |\lambda| \rangle,$$

where $t \mapsto f^*(t) = t\,(f')^{-1}(t) - f\left((f')^{-1}(t)\right)$ is the Legendre transformation of f, $B(X_i) = [B_1(X_i), \ldots, B_K(X_i)]^\top$ denotes the K basis functions of the covariates of unit $i \in \{1, \ldots, n\}$ and $|\lambda| = [|\lambda_1|, \ldots, |\lambda_K|]^\top$, where $|\cdot|$ is the absolute value of a real-valued scalar. Moreover, if $\lambda^\dagger$ is an optimal solution then

$$w_i^* = (f')^{-1}(\langle B(X_i), \lambda^\dagger \rangle), \quad i \in \{1, \ldots, n\} \tag{2.1}$$

are the unique optimal solutions to (P).

Proof. We prove the following Lemma at the end of the section.

Lemma 2.1. *The dual of the optimization problem is*

$$\underset{\lambda \in \mathbb{R}^{2K}}{\text{minimize}} \quad \frac{1}{n} \sum_{i=1}^{n} nT_i f^*(\langle Q_{\bullet i}, \lambda \rangle) - \langle Q_{\bullet i}, \lambda \rangle + \langle d, \lambda \rangle$$

subject to

$$\lambda_k \geq 0 \quad \text{for all } k \in \{1, \ldots, K\}, \tag{2.2}$$

where

$$\mathbf{Q} := \begin{bmatrix} \mathbf{I}_n \\ \mathbf{B}(\mathbf{X}) \\ -\mathbf{B}(\mathbf{X}) \end{bmatrix}, \qquad \mathbf{B}(\mathbf{X}) := \begin{bmatrix} B(X_1), \ldots, B(X_n) \end{bmatrix}, \qquad \text{and} \qquad d := \begin{bmatrix} 0_n \\ \delta \\ \delta \end{bmatrix}. \tag{2.3}$$

$\square$

2.4 Application of Matrix Concentration Inequalities

3 Convex Analysis

3.1 Basic Notions

3.2 Relative Interior

3.3 Conjugate Calculus

3.4 Tseng Bertsekas

We present the relevant parts of the paper [BT03].

Consider the following optimization problem

$$\underset{x \in \mathbb{R}^m}{\text{minimize}} \quad f(x)$$

subject to the constraints

$$\mathbf{A}x \geq b, \tag{3.1}$$

Where $f : \mathbb{R}^m \to \overline{\mathbb{R}}$, $\mathbf{A}$ is a given $n \times m$ matrix, and b is a vector in $\mathbb{R}^n$.

Assumption 3.1. *Assume that the map $f : \mathbb{R}^m \to \overline{\mathbb{R}}$ has the following properties.*

(i) *f is strictly convex.*

(ii) *f is lower-semicontinuous and continuous $\text{dom}(f)$.*

(iii) *The convex conjugate f^* of f is finite.*

The dual optimization problem associated with (P) is

$$\underset{p \in \mathbb{R}^n}{\text{maximize}} \quad q(p)$$

subject to the constraints

$$p \geq 0, \tag{3.2}$$

where $q : \mathbb{R}^n \to \overline{\mathbb{R}}$ is the concave function given by

$$q(p) := \min_{x \in \mathbb{R}^m} f(x) + \langle p, b - \mathbf{A}x \rangle = \langle p, b \rangle - f^*(\mathbf{A}^\top p). \tag{3.3}$$

The dual problem (D) is a concave program with simple nonnegativity constraints. Furthermore, strong duality holds for (P) and (D), i.e., the optimal value of (P) equals the optimal value of (D).

Since f^* is real-valued and f is strictly convex, f^* and q are continuously differentiable.

Theorem 3.1. [Roc70, Theorem 26.3] *A closed proper convex function is (essentially) strictly convex if and only if its conjugate is essentially smooth.*

We will denote the gradient of q at p by $d(p)$ and its ith coordinate by $d_i(p)$. Since q is continuously differentiable, $d_i(p)$ is continuous, and since q is concave, $d_i(p)$ as nonincreasing in p_i.

By differentiating and by using the chain rule, we obtain the dual cost gradient

$$d(p) = b - \mathbf{A}x, \quad \text{where} \quad x := \nabla f^*(\mathbf{A}^\top p) = \text{argsup}_{\xi \in \mathbb{R}^m} \langle p, \mathbf{A}\xi \rangle - f(\xi). \tag{3.4}$$

The last equality follows from Danskin's Theorem and [Roc70, Theorem 23.5]

Proposition 3.1. (Danskin's Theorem [BT03, page 649]) *Let $Z \subseteq \mathbb{R}^m$ be a non-empty set, and let $\phi : \mathbb{R}^n \times Z \to \mathbb{R}$ be a continuous function such that $\phi(\cdot, z) : \mathbb{R}^n \to \mathbb{R}$, viewed as a function of its first argument, is convex for each $z \in Z$. Then the function*

$$f : \mathbb{R}^n \to \mathbb{R}, \qquad x \mapsto \sup_{z \in Z} \phi(x, z) \tag{3.5}$$

is convex and has directional derivative given by

$$f'(x; y) = \sup_{z \in Z(x)} \phi'(x, z; y), \tag{3.6}$$

where $\phi'(x, z; y)$ is the directional derivative of the function $\phi(\cdot, z)$ at x in the direction y, and

$$Z(x) := \left\{ \overline{z} \in \mathbb{R}^m \colon \phi(x, \overline{z}) = \sup_{z \in Z} \phi(x, z) \right\}. \tag{3.7}$$

In particular, if $Z(x)$ consists of a unique point $\overline{z}$ and $\phi(\cdot, \overline{z})$ is differentiable at x, and $\nabla f(x) = \nabla_x \phi(x, \overline{z})$, where $\nabla_x \phi(x, \overline{z})$ is the vector with coordinates $(\partial \phi / \partial x_i)(x, \overline{z})$

Note that x is the unique vector satisfying

$$\mathbf{A}p \in \partial f(x). \tag{3.8}$$

From the optimality conditions for (D) it follows that a dual vector is an optimal solution of (D) if and only if

$$p = [p + d(p)]^+, \tag{3.9}$$

where $[\,\cdot\,]^+$ is the projection onto the positive orthant, i.e., $[y]^+ = [0 \vee y_1, \ldots 0 \vee y_n,]^\top$.

Given an optimal dual solution p, we may obtain an optimal primal solution from the equation $x = \nabla f^*(\mathbf{A}^\top p)$. To see this, note that

$$\mathbf{A}x \geq b \quad \text{and} \quad p_i = 0 \quad \text{for all } i \text{ such that} \quad \sum_{j=1}^m a_{ij} x_j > b_i. \tag{3.10}$$

We can show that p and x satisfy the KKT conditions and thus x is an optimal solution to (P).

Definition 3.1. [Roc70, §28] *By an **ordinary convex program** (P) we mean an optimization problem of the following form*

$$\underset{x \in C}{\text{minimize}} \qquad f_0(x)$$

subject to the constraints

$$f_1(x) \leq 0, \ldots, f_r(x) \leq 0, \qquad f_{r+1}(x) = 0, \ldots, f_m(x) = 0, \tag{3.11}$$

where $C \subseteq \mathbb{R}^n$ is a non-empty convex set, f_i is a finite convex function on C for $i \in \{1, \ldots, r\}$ and f_i is an affine function on C for $i \in \{r+1, \ldots, m\}$.

Definition 3.2. *We define $[\lambda_1, \ldots, \lambda_m] \in \mathbb{R}^m$ to be a **Karush-Kuhn-Tucker (KKT) vector** for (P), if*

(i) $\lambda_i \geq 0$ *for all* $i \in \{1, \ldots, r\}$.

(ii) *The infimum of the proper convex function $f_0 + \sum_{i=1}^m \lambda_1 f_i$ is finite and equal to the optimal value in (P).*

Theorem 3.2. (Karush-Kuhn-Tucker conditions) *Let (P) be an ordinary convex program, $\overline{\alpha} \in \mathbb{R}^m$, and $\overline{z} \in \mathbb{R}^n$. Then $\overline{\alpha}$ is a KKT vector for (P) and $\overline{z}$ is an optimal solution to (P) if and only if $\overline{z}$ and the components α_i of $\overline{\alpha}$ satisfy the following conditions.*

(i) $\alpha_i \geq 0$, $f_i(\overline{z}) \leq 0$, *and* $\alpha_i f_i(\overline{z}) = 0$ *for all* $i \in \{1, \ldots, r\}$.

(ii) $f_i(\overline{z}) = 0$ *for* $i \in \{r+1, \ldots, m\}$.

(iii) $0_n \in [\partial f_0(\overline{z}) + \sum_{\alpha_i \neq 0} \alpha_i \partial f_i(\overline{z})]$.

Proof. [Roc70, Theorem 28.3] $\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\square$

Takeaways For strictly convex functions we can derive duality in terms of the optimal solutions.

4 Random Matrix Inequalities

4.1 Matrix Analysis

The **trace** of a square matrix, denoted by tr, is the sum of its diagonal entries, i.e. $\mathrm{tr}(\mathbf{B}) = \sum_{j=1}^{d} b_{jj}$ for $\mathbf{B} \in \mathbb{M}_d$. The trace is unitarily invariant, i.e. $\mathrm{tr}(\mathbf{B}) = \mathrm{tr}(\mathbf{Q}\mathbf{B}\mathbf{Q}^*)$ for all $\mathbf{B} \in \mathbb{M}_d$ for all unitary $\mathbf{Q} \in \mathbb{M}_d$. In particular, the existence of an eigenvalue value decomposition shows that the trace of a Hermitian matrix equals the sum of its eigenvalues. Let $f : I \to \mathbb{R}$ where $I \subseteq \mathbb{R}$ is an interval. Consider a matrix $\mathbf{A} \in \mathbb{H}_d$ whose eigenvalues are contained in I. We define the matrix $f(\mathbf{A}) \in \mathbb{H}_d$ using an eigenvalue decomposition of $\mathbf{A}$:

$$f(\mathbf{A}) = \mathbf{Q} \begin{bmatrix} f(\lambda_1) & & \\ & \ddots & \\ & & f(\lambda_d) \end{bmatrix} \mathbf{Q}^* \qquad \text{where} \qquad \mathbf{A} = \mathbf{Q} \begin{bmatrix} \lambda_1 & & \\ & \ddots & \\ & & \lambda_d \end{bmatrix} \mathbf{Q}^*. \qquad (4.1)$$

The definition of $f(\mathbf{A})$ does not depend on which eigenvalue decomposition we choose. Any matrix function that arises in this fashion is called a **standard matrix function**.

Proposition 4.1. *Let $f, g : I \to \mathbb{R}$ be real-valued functions on an interval $I \subseteq \mathbb{R}$, and let $\mathbf{A} \in \mathbb{H}_d$ be a Hermitian matrix whose eigenvalues are contained in I.*

(i) If λ is an eigenvalue of of $\mathbf{A}$, then $f(\lambda)$ is an eigenvalue of $f(\mathbf{A})$.

(ii) $f(a) \leq g(a)$ for all $a \in I$ implies $f(\mathbf{A}) \preccurlyeq g(\mathbf{A})$.

Lemma 4.1. (Mean value trace inequality) *Let I be an interval of the real line. Suppose that $g : I \to \mathbb{R}$ is a weakly increasing function and that $h : I \to \mathbb{R}$ is a function whose derivative h' is convex. Then for all matrices $\mathbf{A}, \mathbf{B} \in \mathbb{H}_d(I)$ it holds*

$$\overline{\mathrm{tr}}[(g(\mathbf{A}) - g(\mathbf{B})) \cdot (h(\mathbf{A}) - h(\mathbf{B}))] \leq \frac{1}{2} \overline{\mathrm{tr}}[(g(\mathbf{A}) - g(\mathbf{B})) \cdot (\mathbf{A} - \mathbf{B}) \cdot (h'(\mathbf{A}) + h'(\mathbf{B}))]. \quad (4.2)$$

When h' is concave, the inequality is reversed. The same result holds for the standard trace.

Proof. *[MJC+14, Lemma 3.4]* Fix $a, b \in I$. Since g is weakly increasing, $(g(a) - g(b)) \cdot (a - b) \geq 0$. The fundamental theorem of calculus and the convexity of h' yield the estimate

$$(g(a) - g(b)) \cdot (h(a) - h(b)) = (g(a) - g(b)) \cdot (a - b) \int_0^1 h'(\tau a + (1 - \tau)b)\mathrm{d}\tau \qquad (4.3)$$

$$\leq (g(a) - g(b)) \cdot (a - b) \int_0^1 [\tau h'(a) + (1 - \tau)h'(b)]\mathrm{d}\tau \qquad (4.4)$$

$$= \frac{1}{2} [(g(a) - g(b)) \cdot (a - b) \cdot (h'(a) + h'(b))]. \qquad (4.5)$$

The inequality is reversed, if h' is concave. $\qquad\qquad \square$

Proposition 4.2. (Generalized Klein inequality) *Let $u_1, \ldots, u_n$ and $v_1, \ldots, v_n$ be real-valued functions on an interval I of the real line. Suppose*

$$\sum_{k=1}^{n} u_k(a) v_k(b) \geq 0 \qquad \text{for all } a, b \in I. \tag{4.6}$$

Then

$$\overline{\text{tr}} \left(\sum_{k=1}^{n} u_k(\mathbf{A}) v_k(\mathbf{B}) \right) \geq 0 \qquad \text{for all } \mathbf{A}, \mathbf{B} \in \mathbb{H}_d(I). \tag{4.7}$$

Proof. *[Pet94, Proposition 3]* $\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\square$

Proposition 4.3. (Hölder inequality for trace) *Let p and q be Hölder conjugate indices. Then*

$$\text{tr}(\mathbf{BC}) \leq \|\mathbf{B}\|_p \|\mathbf{C}\|_q \qquad \text{for all } \mathbf{B}, \mathbf{C} \in \mathbb{M}_d. \tag{4.8}$$

Proof. *[Bha97, Corollary IV.2.6]* $\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\square$

4.2 Matrix Concentration Inequalities via the Method of Exchangeable Pairs

Definition 4.1. *Let Z and Z' random variables taking values in a Polish space $\mathcal{Z}$. We say that (Z, Z') is an **exchangable pair** if it has the same distribution as (Z', Z). In particular, Z and Z' must share the same distribution.*

Definition 4.2. *Let (Z, Z') be an exchangable pair of random variables taking values in a Polish space $\mathcal{Z}$, and let $\mathbf{\Psi} : \mathcal{Z} \to \mathbb{H}_d$ be a measurable function. Define the random Hermitian matrices*

$$\mathbf{X} := \mathbf{\Psi}(Z) \quad and \quad \mathbf{X}' := \mathbf{\Psi}(Z'). \tag{4.9}$$

*We say that $(\mathbf{X}, \mathbf{X}')$ is a **matrix Stein pair** if there is a constant $\alpha \in (0, 1]$ for which*

$$\mathbf{E}[\mathbf{X} - \mathbf{X}'|Z] = \alpha \mathbf{X} \qquad almost \ surely. \tag{4.10}$$

*The constant α is called the **scale factor** of the pair. We always assume $\mathbf{E}\left[\|\mathbf{X}\|^2\right] < \infty$.*

Lemma 4.2. *Suppose that $(\mathbf{X}, \mathbf{X}')$ is a matrix Stein pair with scale factor α. Let $\mathbf{F} : \mathbb{H}_d \to \mathbb{H}_d$ be a measurable function that satisfies the regularity condition $\mathbf{E}\left[\left\|(\mathbf{X} - \mathbf{X}')\mathbf{F}(\mathbf{X})\right\|\right] < \infty$. Then*

$$\mathbf{E}[\mathbf{X} \cdot \mathbf{F}(\mathbf{X})] = \frac{1}{2\alpha} \mathbf{E}[(\mathbf{X} - \mathbf{X}')(\mathbf{F}(\mathbf{X}) - \mathbf{F}(\mathbf{X}'))]. \tag{4.11}$$

Proof. *[MJC⁺14, Lemma 2.4]* Suppose that $(\mathbf{X}, \mathbf{X}')$ constructed from an auxiliary exchangable pair (Z, Z'). The defining property implies

$$\alpha \cdot \mathbf{E}[\mathbf{X} \cdot \mathbf{F}(\mathbf{X})] = \mathbf{E}[\mathbf{E}[\mathbf{X} - \mathbf{X}'|Z] \cdot \mathbf{F}(\mathbf{X})] = \mathbf{E}[(\mathbf{X} - \mathbf{X}')\mathbf{F}(\mathbf{X})] \tag{4.12}$$

$$\square$$

4.3 Matrix Khintchin Inequality

Theorem 4.1. (Matrix BDG inequality) *Let $p = 1$ or $p \geq 3/2$. Suppose that $(\mathbf{X}, \mathbf{X}')$ is a matrix Stein pair where $\mathbf{E}[\|\mathbf{X}\|_{2p}^{2p}] < \infty$. Then*

$$\mathbf{E}[\|\mathbf{X}\|_{2p}^{2p}]^{1/(2p)} \leq \sqrt{2p - 1}\ \mathbf{E}[\|\mathbf{\Delta_X}\|_p^p]^{1/(2p)}, \tag{4.13}$$

where $\mathbf{\Delta_X}$ is the conditional variance .

Proof. *[MJC+14, §7.3]* Apply method of exchangeable pairs, generalized Klein inequality, trace Hölder □

Theorem 4.2. [MJC+14, Corollary 7.3] *Suppose that $p = 1$ or $p \geq 3/2$. Consider a finite sequence $(\mathbf{Y}_k)_{k \geq 1}$ of independent, random, Hermitian matrices and a deterministic sequence $(\mathbf{A}_k)_{k \geq 1}$ for which*

$$\mathbf{E}[\mathbf{Y}_k] = 0 \quad and \quad \mathbf{Y}_k^2 \preccurlyeq \mathbf{A}_k^2 \qquad almost\ surely\ for\ all\ k \geq 1. \tag{4.14}$$

Then

$$\mathbf{E}\left[\left\|\sum_{k \geq 1} \mathbf{Y}_k\right\|_{2p}^{2p}\right]^{1/(2p)} \leq \sqrt{p - \frac{1}{2}}\left\|\left(\sum_{k \geq 1}(\mathbf{A}_k^2 + \mathbf{E}[\mathbf{Y}_k^2])\right)^{1/2}\right\|_{2p}. \tag{4.15}$$

In particular, when $(\xi_k)_{k \geq 1}$ is an independent sequence of Rademacher random variables,

$$\mathbf{E}\left[\left\|\sum_{k \geq 1} \xi_k \mathbf{A}_k\right\|_{2p}^{2p}\right]^{1/(2p)} \leq \sqrt{2p - 1}\left\|\left(\sum_{k \geq 1} \mathbf{A}_k^2\right)^{1/2}\right\|_{2p}. \tag{4.16}$$

4.4 Matrix Moment Inequality

Theorem 4.3. *Assume $n \geq 3$*

   (i) Suppose that $p \geq 1$, and fix $r \geq p \vee 2\log(n)$. Consider a finite sequence $(\mathbf{S}_k)_{k \geq 1}$ of independent, random, positive-semidefinite matrices with dimension $n \times n$. Then

$$\mathbf{E}\left[\left\|\sum_{k \geq 1} \mathbf{S}_k\right\|^p\right]^{1/p} \leq \left[\left\|\sum_{k \geq 1} \mathbf{E}[\mathbf{S}_k]\right\|^{1/2} + 2\sqrt{er}\mathbf{E}[\max_{k \geq 1}\|\mathbf{S}_k\|^p]^{1/(2p)}\right]^2. \tag{4.17}$$

   (ii) Suppose that $p \geq 2$, and fix $r \geq p \vee 2\log(n)$. Consider a finite sequence $(\mathbf{Y}_k)_{k \geq 1}$ of independent, symmetric, random, self-adjoint matrices with dimension $n \times n$. Then

$$\mathbf{E}\left[\left\|\sum_{k \geq 1} \mathbf{Y}_k\right\|^p\right]^{1/p} \leq \sqrt{er}\left\|\left(\sum_{k \geq 1}\mathbf{E}[\mathbf{Y}_k^2]\right)^{1/2}\right\| + 2er\mathbf{E}[\max_{k \geq 1}\|\mathbf{S}_k\|^p]^{1/p}. \tag{4.18}$$

4.5 Intrinsic Dimension

Definition 4.3. *For a positive-semidefinite matrix* $\mathbf{S}$*, the **intrinic dimension** is the quantity*

$$\text{intdim}(\mathbf{A}) := \frac{\text{tr}\mathbf{A}}{\|\mathbf{A}\|}.$$

Lemma 4.3. (Intrinsic dimenision) *Let* $\varphi : [0, \infty) \to \mathbb{R}$ *be a convex function with* $\varphi(0) = 0$. *For any positive-semidefinite matrix* $\mathbf{S}$ *it holds that*

$$\text{tr}(\varphi(\mathbf{S})) \leq \text{intdim}(\mathbf{S}) \cdot \varphi(\|\mathbf{S}\|).$$

Proof. *[Tro15, Lemma 7.5.1]* Since φ is convex on any interval $[0, L]$ with $L > 0$ and $\varphi(0) = 0$, it holds

$$\varphi(a) \leq \left(1 - \frac{a}{L}\right) \varphi(0) + \frac{a}{L}\varphi(L) = \frac{a}{L}\varphi(L) \qquad \text{for all } a \in [0, L]. \tag{4.19}$$

Since $\mathbf{S}$ is positive-semidefinite, the eigenvalues of $\mathbf{S}$ fall in the interval $[0, L]$, where $L = \|\mathbf{S}\|$.

$$\text{tr}(\varphi(\mathbf{S})) = \sum_{i=1}^{d} \varphi(\lambda_i) \leq \frac{\sum_{i=1}^{d} \lambda_i}{\|\mathbf{S}\|}\varphi(\|\mathbf{S}\|) = \frac{\text{tr}(\mathbf{S})}{\|\mathbf{S}\|}\varphi(\|\mathbf{S}\|) = \text{intdim}(\mathbf{S}) \cdot \varphi(\|\mathbf{S}\|). \tag{4.20}$$

$\square$

5 Empirical Processes

Let $(\Omega, \mathcal{A}, \mathbf{P})$ be a probability space and $(\mathcal{X}, \Sigma)$ a measurable space. Let $X_j : (\Omega, \mathcal{A}, \mathbf{P}) \to (\mathcal{X}, \Sigma)$, $j = 1, \ldots, n$ be independent and identically-distributed (i.i.d.) random variables with probability distribution $\mathbf{P}_X$ and $\mathcal{F}$ a family of measurable functions $f : (\mathcal{X}, \Sigma) \to (\mathbb{R}, \mathcal{B}(\mathbb{R}))$. Consider the map

$$f \mapsto G_n f := \sqrt{n} \left(\frac{1}{n} \sum_{i=1}^{n} f(X_i) - \mathbf{P}_X f \right), \tag{5.1}$$

where $\mathbf{P}_X f := \int_{\mathcal{X}} f \mathrm{d}\mathbf{P}_X$. We call $(G_n f)_{f \in \mathcal{F}}$ the empirical process indexed by $\mathcal{F}$. Furthermore

$$\|G_n f\|_{\mathcal{F}} := \sup_{f \in \mathcal{F}} |G_n f|. \tag{5.2}$$

Lemma 5.1. (Bernstein Inequality for Empirical Processes) *For any bounded, measurable function f it holds for all $t > 0$*

$$\mathbf{P}\left(|G_n f| > t\right) \leq 2 \exp\left(-\frac{1}{4} \frac{t^2}{\mathbf{P}_X(f^2) + t \|f\|_{\infty} / \sqrt{n}} \right) \tag{5.3}$$

Proof. By the Markov inequality it holds for all $\lambda > 0$

$$\mathbf{P}\left(G_n f > t\right) \leq e^{-\lambda t} \mathbf{E} \exp\left(\lambda G_n f\right) \tag{5.4}$$

$\square$

Lemma 5.2. *For any finite class $\mathcal{F}$ of bounded, measurable, square-integrable functions, with $|\mathcal{F}|$ elements, it holds*

$$\mathbf{E} \|G_n f\|_{\mathcal{F}} \lesssim \max_{f \in \mathcal{F}} \frac{\|f\|_{\infty}}{\sqrt{n}} \log\left(1 + |\mathcal{F}|\right) + \max_{f \in \mathcal{F}} \|f\|_{\mathbf{P},2} \sqrt{\log\left(1 + |\mathcal{F}|\right)}. \tag{5.5}$$

6 Simple yet useful Calculations

Theorem 6.1. (Multivariate Taylor Theorem) *Let $f \in C^2(\mathbb{R}^n, \mathbb{R})$. Then for all $x, \Delta \in \mathbb{R}^n$ there exists $\xi \in [0,1]$ such that it holds*

$$
\begin{aligned}
f(x + \Delta) = f(x) + \sum_{i=1}^{n} \frac{\partial f(x)}{\partial x_i} \Delta_i + \sum_{\substack{i,j=1 \\ i \neq j}} \frac{\partial^2 f(x + \xi\Delta)}{\partial x_i \partial x_j} \Delta_i \Delta_j \\
+ \frac{1}{2} \sum_{i=1}^{n} \frac{\partial^2 f(x + \xi\Delta)}{\partial x_i^2} \Delta_i^2
\end{aligned}
\tag{6.1}
$$

Corollary 6.1.1. *Let $f \in C^2(\mathbb{R})$. Then for all $a, x, \Delta \in \mathbb{R}^n$ there exist $\xi \in [0,1]$ such that it holds*

$$
f(a^T(x + \Delta)) - f(a^T x) = f'(a^T x)\,\Delta^T a + \frac{1}{2} f''(a^T(x + \xi\Delta))\,\Delta^T A\,\Delta,
\tag{6.2}
$$

where $A := aa^T \in \mathbb{R}^{n \times n}$.

Proof. By the chain rule we have for all $a, x, \Delta \in \mathbb{R}^n$ and $\xi \in [0,1]$

$$
\frac{\partial^2 f(a^T(x + \xi\Delta))}{\partial x_i \partial x_j} = f''(a^T(x + \xi\Delta))\,a_i a_j.
\tag{6.3}
$$

Since $A := aa^T$ is symmetric we have

$$
\Delta^T A\,\Delta = 2 \sum_{\substack{i,j=1 \\ i \neq j}}^{n} a_i a_j \Delta_i \Delta_j + \sum_{i=1}^{n} a_i^2 \Delta_i^2.
\tag{6.4}
$$

Plugging (6.3) and (6.4) into (6.1) yields (6.2). $\qquad\square$

Proposition 6.1. *For all $x, y \in \mathbb{R}$ it holds*

$$
|x + y| - |x| \geq -|y|
\tag{6.5}
$$

Proof. Checking all 6 combinations of $x + y, x, y$ being nonnegative or negative yields the result. $\qquad\square$

$\mathbb{R}$ set of real numbers

$x \vee y, x \wedge y, x^+, x^-$ maximum, minimum, positive part, negative part of real numbers

$X \sim \mu$ the random variable has distribution μ
